

When does Bernoulli apply:

- (1) there is an exact no. of trials (n) .
- (2) only 2 outcomes - "success" or "fail"
- (3) $P(\text{success}) = p$
 $P(\text{fail}) = q$
 p and q are constant throughout the experiment.
- (4) all events are independent.

Example 1

An unbiased die is thrown 5 times. Find the probability of obtaining

(i) 1 six

(ii) 3 sixes

(iii) at least 1 six.

$$P(r \text{ successes}) = \binom{n}{r} p^r q^{n-r}$$

$$p = P(6) = \frac{1}{6}$$

$$q = P(\text{not } 6) = \frac{5}{6}$$

$$r = \text{no. 6s} = 3 \leftarrow \text{successes}$$

$$n = \text{no. trials} = 5$$

$$p = P(6) = \frac{1}{6}$$

$$q = P(\text{not } 6) = \frac{5}{6}$$

$$r = 0$$

$$n = 5$$

$$P(3 \text{ sixes}) - ?$$

$$= \binom{5}{3} \left(\frac{1}{6}\right)^3 \left(\frac{5}{6}\right)^2$$

$$= \frac{125}{388}$$

$$P(\text{at least 1 six}) = 1 - P(\text{no six})$$

$$= 1 - \binom{5}{0} \left(\frac{1}{6}\right)^0 \left(\frac{5}{6}\right)^5$$

$$= 1 - (1)(1) \left(\frac{3125}{7776}\right)$$

$$= \frac{4651}{7776}$$

Combinations

$$\binom{n}{r} \quad \text{or} \quad nCr$$

Calculator

$$\binom{5}{0} = 5C0$$
$$= 1$$
